

# **K Nearest Neighbor**

## **Instance Based Learning**

- Also known as "Lazy Learning"
- Store the given training data and don't learn any model
- During query time, retrieve a set of "similar" instances from the training data and use them to classify/predict the new instance
- Essentially construct only local approximations to the target function
- There is no global model learnt to perform well across all instances

## **K-NN (K-Nearest Neighbours)**

- One of the most basic forms of instance learning
- K-NN Algorithm for Classification
- Training method:
  - Save the training examples
- •At prediction time:
  - Find the k training examples (x1,y1),...(xk,yk) that are closest to the test example x
  - Predict the most frequent class among those yi's.

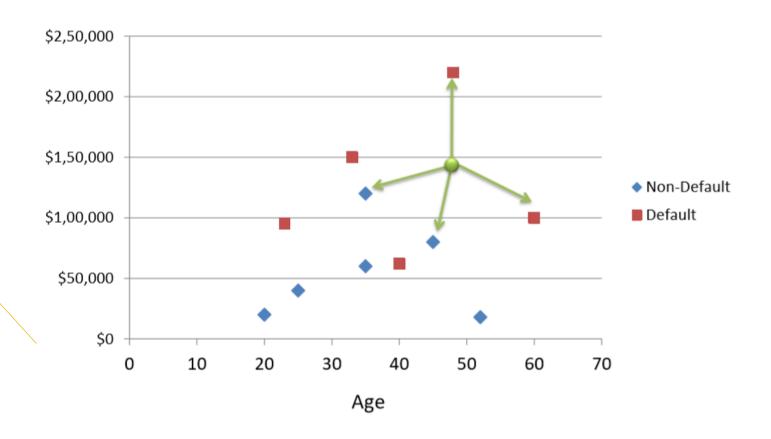

#### **K-NN - Classification**

- One of the most basic forms of instance learning
- K-NN Algorithm for Classification
- •Training method:
  - Save the training examples
- •At prediction time:
  - Find the k training examples (x1,y1),...(xk,yk) that are closest to the test example x
  - Predict the most frequent class among those yi's.

#### **K-NN - Classification**

## K-NN - Classification (Contd..)

| Age | Loan      | Default | Distance |
|-----|-----------|---------|----------|
| 25  | \$40,000  | N       | 102000   |
| 35  | \$60,000  | N       | 82000    |
| 45  | \$80,000  | N       | 62000    |
| 20  | \$20,000  | N       | 122000   |
| 35  | \$120,000 | N       | 22000    |
| 52  | \$18,000  | N       | 124000   |
| 23  | \$95,000  | Υ       | 47000    |
| 40  | \$62,000  | Υ       | 80000    |
| 60  | \$100,000 | Υ       | 42000    |
| 48  | \$220,000 | Υ       | 78000    |
| 33  | \$150,000 | Υ       | 8000     |
|     |           |         |          |
| 48  | \$142,000 | ?       |          |

Euclidean Distance 
$$D = \sqrt{(x_1 - x_2)^2 + (y_1 - y_2)^2}$$

## K-NN – Classification (Contd ..)

| Age   | Loan | Default         | Distance |
|-------|------|-----------------|----------|
| 0.125 | 0.11 | N               | 0.7652   |
| 0.375 | 0.21 | N               | 0.5200   |
| 0.625 | 0.31 | N ←             | 0.3160   |
| 0     | 0.01 | N               | 0.9245   |
| 0.375 | 0.50 | N               | 0.3428   |

$$X_{s} = \frac{X - Min}{Max - Min}$$

10

#### **K-NN Decision Boundaries**

Voronoi Diagrams

11

## How to determine a good value of "K"

- Usually tuned using a validation set
- Start with k=1 and test the error rate on validation set
- Repeat with k=k+2
- Choose the value of k which has minimum error rate on validation set
- Note: Odd values of k chosen to avoid ties

## **Improving K-NN**

- Weighting examples from the neighborhood
- Measuring "closeness"
- Finding "close" examples in a large training set quickly
